Wireless Solutions for Smart Parking
Solutions for On-Street Parking

Background
Increased population density in growing communities often correlates to increased levels of vehicle congestion on roadways, limiting mobility, access to businesses, housing, and leisure activities as well as the availability of on-street parking.

Solution
The wireless M-GAGE Parking Sensor is a compact and easy to deploy solution for monitoring single parking spaces, allowing cities to better manage the parking challenges of today and tomorrow.

- Reliably detects large ferromagnetic objects using a three-axis magneto-resistive technology
- Automatically communicates parking space status by radio to the closest Gateway
- Parking space availability information can be sent to a remote supervision system for real-time visualization and statistics or enforcement via GSM/Cellular, RS-485 or Ethernet using a DXM100 Wireless Controller

Extended Connectivity to Smart Devices
For detailed product information, see page 13.

M-GAGE Parking Sensors
For detailed product information, see pages 10 and 12.
Background
The layout of an off-street parking facility, its exposure to the elements, the material used to pave the surface, and the maintenance required at the facility are all necessary considerations for deploying a smart parking solution.

Solution
Banner Engineering offers three different installation possibilities to cover all scenarios:

1. **Underground**: a fully potted and epoxy sealed sensor is installed under the road surface
2. **Flush mount**: the sensor is housed in a protective enclosure and installed 30 mm deep into the lot surface, ensuring that the sensor remains accessible for maintenance
3. **Surface mount**: a heavy duty protective enclosure houses the sensor and is affixed to the road surface, allowing easy access to the sensor – this is the fastest and least intrusive installation

For detailed product information, see page 10.
Solutions for Underground Parking

Background
Underground parking garages often support above ground businesses, shops, and entertainment venues in urban areas. The design and build of these facilities can pose unique challenges in the implementation of a smart parking solution.

Solution
Banner offers a simple, cost-effective solution that enables motorists to quickly find available parking in underground parking facilities. This solution combines sensors and indicators in a wireless network, enabling rapid deployment in any parking facility.

Ultrasonic Sensor Node:
- Uses sound waves to detect objects and can be mounted directly on the ceiling of a parking garage to identify the presence of a car in the parking space below
- Has an integrated lithium D-cell battery with a seven year lifespan which reduces the cost of installation by eliminating the need to run wires and conduit

Wireless Light Node:
- Flashes green to direct drivers to the nearest available parking spaces
- Has an integrated lithium D-cell battery

Wireless Gateway
Light Node
Ultrasonic Node

For detailed product information, see pages 11 and 12.
Effective Parking Guidance

Background
Helping motorists to quickly find available parking can minimize traffic congestion and vehicle emissions in confined and enclosed underground parking garages. The diverse configurations of these facilities can challenge the effectiveness of many parking guidance systems.

Solution
- A single Light Node can provide clear indication of availability for up to six parking spaces when mounted on the side or in the middle of a garage corridor.
- The supervision system can link a specific Light Node with a group of Ultrasonic Nodes, keeping the green LEDs active as long as at least one parking space of the group is free, which reduces the overall cost of installation.
- All display solutions for driver information and guidance that use RS-485 modbus RTU communication can be managed with Banner wireless devices, allowing users to avoid the expense and hassle of additional cabling.
Vehicle Detection and Counting

Background
Detecting, counting, and classifying vehicles is essential to many parking applications. To manage time and ensure availability at shared recharging stations for electric cars, the parking system must be able to detect unauthorized vehicles and alert authorities to their presence.

Solution
R-GAGE radar sensors are capable of solving a more diverse range of vehicle detection applications than other sensing technologies, including inductive loops.

■ Detects moving and stationary targets up to 24 m away
■ Frequency modulated continuous wave (FMCW) radar ensures reliable detection in all weather conditions
■ Rugged IP67 rated housing withstands harsh conditions
■ Non-intrusive, easy-to-install and easy-to-use solution that does not require any specific maintenance

For detailed product information, see page 14.
Access Control

Background
The ability to reliably detect the presence of a vehicle is common to many access control applications. Infrastructure and conditions at any given deployment can vary. Solutions that are easy to install and use can help reduce deployment costs and minimize downtime at a site.

Solution
Banner offers a range of minimally intrusive sensing solutions that include radar, magnetic field, and photoelectric sensors.

M-GAGE™ Q7LMEB Flat-Pak:
- Reliably detects large metal objects using a three-axis magneto-resistive technology
- Minimally intrusive solution can be installed below ground in a shallow, narrow trench or above ground on the side of the inspection area
- Protected by a heat shrink sealed encapsulated circuit board housing and adhesive-lining
- Installs in a fraction of time required to repair or replace failed inductive loops

SureCross® Q45:
- First self-contained wireless standard photoelectric solution developed to solve highly challenging detection applications
- Highly scalable, this wireless sensor can detect vehicles in a range of applications without pulling cables

For detailed product information, see page 15. For detailed product information, see page 14.
Banner’s DX80 Star topology is based on Performance Gateways to create a point-to-multipoint network using parking sensors (up to 47 sensors depending on local signal strength). This network topology features bit-pack functions for fast response time in specific applications like vehicle counting or monitoring a large number of parking spaces.

The gateway for each of the DX80 Performance networks can be hard wired to a MultiHop Data Radio so that it can use repeaters to cover long distances and bring back all of the information to a DXM100 Wireless Controller.

The DXM100 Controller offers extended connectivity capabilities (GSM/Cellular, Ethernet, USB, Serial communication) and can push data to a PLC or a web server.

**Key Features:**
- Simple yet highly expandable
- Supports Point-to-Multipoint and Star network topologies
- Quick communication feature with bit-pack functions
Network Layout with MultiHop Data Radio

The MultiHop Data Radio is a tree topology network with self-healing capability that includes wireless parking sensors transmitting information to repeaters, which ultimately transmit to the master radio. The use of repeaters can greatly extend the range of the network. This configuration is used for extended site with distant wireless sensors as for specific on-street applications. This network must have a host controller that controls the master radio or a DXM100 Wireless Controller to extend the connectivity capabilities (GSM/Cellular, Ethernet) and push data to a web server or a supervision system.

Key Features:
- Self-healing, auto-routing RF network with multiple hops extends the network’s range:
  - 900 MHz, 1 Watt: up to 9.6 km (6 miles)
  - 2.4 GHz, 65 mW: up to 3.2 km (2 miles)
- Flexible: each radio is DIP switch selectable to be a master, repeater or slave
- User-selectable communication between RS-485 and RS-232 that can be used to manage remote devices
Wireless Sensor Model Selection

M-GAGE Parking Sensor – Low Profile
- Adjustable sensor parameters
- 3x A-cell lithium batteries integrated into housing
- 8 years battery lifetime (with standard settings and effective communication strength)
- Fully potted and sealed housing contains the power source, sensor, and antenna for a completely wireless solution

M-GAGE Low Profile Parking Sensor with Integrated Batteries

Wireless Sensor Node Model Selection

**Ultrasonic Sensor Node**
- Wireless industrial I/O device with an ultrasonic sensor integrated into the housing
- FlexPower® technology driven by 1x lithium primary battery
- Easily replaceable D-cell lithium battery (integrated into the housing)
- 7 years battery lifetime (with standard settings and effective communication strength)
- Power-efficient occupancy sensor for parking applications
- Range up to 4000 mm; sample rate 10 s (adjustable)

Cluster Head Model Selection

The cluster head is a combination of two radio devices connected together by RS-485. The Gateway of the DX80 network collects the local sensor’s status. The MultiHop Data Radio repeater transfers all information to the master in the control room. Both Gateway and Data Radio repeater are available as IP20 boards or in IP67 housings.

### Cluster Head in IP67 Housing
- Radio range: 900 MHz: up to 9.6 km (6 miles) or 2.4 GHz: up to 3.2 km (2 miles)
- Interface: 2-wire half-duplex RS-485 Modbus RTU
- Power: +10-30 VDC or 3.6-5.5 VDC

The DXM100 Controller is an industrial wireless controller developed to facilitate Ethernet connectivity and Industrial Internet of Things (IIoT) applications. Available with an internal DX80 Gateway or a MultiHop Data Radio, this powerful Modbus communications device connects local wireless networks with the internet and/or host systems.

**DXM Wireless Controller**

- ISM radios available in 900 MHz and 2.4 GHz for local wireless network
- Converts Modbus RTU to Modbus TCP/IP or Ethernet I/P
- Logic controller can be programmed using action rules and text language methods (scripting)
- Micro SD card for data logging
- Email and text alerts
- Local I/O options: universal inputs, NMOS outputs, and analog outputs
- Powered by 12 to 30 VDC, 12 VDC solar panel, or battery backup
- RS-232, RS-485, and Ethernet communications ports; and a USB configuration port
- LCD display for I/O information and user programmable LED’s
- 2.4 GHz Compliance: models listed are in accordance with EN 300 328: V1.8.1 (2012-06)
- -20 °C to +80 °C (-4 °F to +176 °F) operating temperature
- Dimensions 105 x 60 x 86 mm (L x W x H)

R-GAGE Radar Sensor Model Selection

R-GAGE QT50R-AF Sensor

- FMCW (true-presence) radar detects moving and stationary objects
- Higher sensitivity and shorter range
- Adjustable sensing field – ignores objects beyond setpoint
- Easy setup and configuration of range, sensitivity, and output with simple DIP switches
- Resilient to outdoor environment (Rain, Fog, Snow, Wind, Vibrations), it can be placed behind a plastic window for antivandalism purposes
- Operating Temperature from -40 °C to +65 °C (-40 °F to +149 °F)
- 12 to 30 VDC (<100 mA) – Bipolar 1x NPN, 1x PNP; Dip-Switch Selectable Outputs N.O. or N.C.

Q45 Wireless Sensor Model Selection

Q45 Wireless Sensor

- True self-contained wireless with no cables, cordsets or external power
- 1 km line-of-sight
- Built-in antenna
- 2.4 GHz unlicensed frequency
- Used exclusively with Banner’s DX80 Gateways
- Default sensing interval 62.5 milliseconds

M-GAGE Q7LMEB Flat-Pak

- Suitable for below ground installation, designed for indoor or outdoor applications, above or below grade
- Encapsulated circuit board housing sealed with adhesive-lined heat shrink
- Capable of detecting vehicles that have stopped within the sensor’s sensing field
- 3-axis magneto resistive-based technology; senses 3-dimensional changes to the earth’s magnetic field caused by the presence of ferrous objects
- Compact, robust one-piece, self-contained sensor package replaces inductive-loop sensing technology; no external controller needed
- Designed to minimize the effects of temperature swings and destabilizing magnetic fields
- Sensor learns ambient background and stores settings; sensor will not lose configuration or range when power is cycled
