SI-LS31R Series 31mm Limit-Switch Style with Rotary Hinge Actuator

- Limited switch design (EN 50047)
- Rotating shaft connects directly to door hinge
- Positive opening safety contacts (IEC 60947-5-1), not dependent on springs
- Glass-reinforced thermoplastic switch housing with plated steel actuator
- Insulated device (IEC 60947-5-1) on all models with plastic housings
- Actuator head is rotatable in 90 degree increments

Note: This symbol for a positive-opening safety contact (IEC 60947-5-1) is used in the switching diagrams to identify the point in actuator travel where the normally closed safety contact is fully open.

The closed contact (11-12) fully opens (i.e., positive break occurs) within ± 30° of the neutral shaft position.
Important Information Regarding the Use of Safety Switches

In the United States, the functions that Banner safety switches are intended to perform are regulated by the Occupational Safety and Health Administration (OSHA). Whether or not any particular safety switch installation meets all applicable OSHA requirements depends upon factors that are beyond the control of Banner Engineering Corp. These factors include the details of how the safety switches are applied, installed, wired, operated, and maintained.

Banner Engineering Corp. has attempted to provide complete application, installation, operation, and maintenance instructions. This information is found in the instruction manual packaged with each safety switch. In addition, we suggest that any questions regarding the use or installation of safety switches be directed to the factory applications department at the telephone numbers or address shown below.

Banner Engineering Corp. recommends that safety switches be applied according to the guidelines set forth in international (ISO/IEC) standards listed below. Specifically, Banner Engineering Corp. recommends application of these safety switches in a configuration which meets safety category 4, per ISO 13849 (EN954-1).

In addition, the user of Banner safety switches has the responsibility to ensure that all local, state, and national laws, rules, codes, and regulations relating to the use of Banner safety switches in any particular application are satisfied. Extreme care is urged that all legal requirements have been met and that all installations and maintenance instructions are followed.

Installation

Mechanical Installation

**WARNING:** Hazard Point

It must not be possible for personnel to reach any hazard point through an opened guard (or any opening) before hazardous machine motion has completely stopped.

**Important:** Install a safety switch in a manner that discourages tampering or defeat. Mount switches to prevent bypassing of the switching function at the terminal chamber.
The actuator head can be rotated to any of four positions in 90° increments. See Figure 1 on page 3. To reposition the actuator head, follow these steps.

1. With the actuator at 0°, loosen the four screws holding the actuator head to the switch body.
2. Loosen the four screws holding the actuator head to the switch body.
3. Lift the actuator head away from the spring and gasket and rotate it to the desired position.
4. Press the actuator head down firmly to compress the spring, and re-fasten the four screws.

All mounting hardware is supplied by the user. The fasteners must be of sufficient strength to guard against incidental breakage. Use of permanent fasteners or locking hardware is recommended to prevent loosening or displacement of the actuator and switch body. The mounting holes in the switch body accept M4 (#8) screws.

Position the switch, with its actuator fully engaged, in the mounting location and mark the mounting holes. Drill the required holes and fasten the switch body and the actuator in place. After the mounting hardware is secure, check the actuator/switch engagement for misalignment and binding.

![Figure 1. Loosen four screws to rotate actuator head to any of four 90° positions](image)

### Electrical Installation

**CAUTION: Electrical Installation**

Two safety switches must be used for each interlock guard to achieve control reliability or Safety Category 4 (per ISO 13849-1, EN 954-1) of a machine stop circuit. Use of only one safety switch per interlock guard is not recommended.

In addition, normally-closed safety contacts from each of the two safety switches should be connected to the two separate inputs of a 2-channel safety module or safety interface. This is required to provide monitoring for safety switch contact failure, and to provide the necessary reset routine, as required by IEC 60204-1 and NFPA 79 machine safety standards.

![Figure 2. Features](image)

**WARNING:**
- A Series Connection of Safety Interlock Switches—Monitoring multiple guards with a series connection of multiple safety interlock switches is not a Safety Category 4 Application (per ISO 13849-1, EN 954-1).
- A single failure may be masked or not detected at all.
- When such a configuration is used, procedures must be performed regularly to verify proper operation of each switch.

### Access to the Wiring Chamber

Access the wiring chamber using the hinged door. Insert a flat-blade screwdriver and pry gently down to open. A conduit adapter is supplied to convert the German M20 x 1.5 thread to ½ 14 NPT. An accessory cable gland that fits the M20 × 1.5 thread is available.

![Figure 3. Typical alignment on a door](image)

### Connection to a Machine

Two types of contacts are offered. The contacts between terminals 11–12 and 21–22 are the safety contacts, which are closed (i.e., they conduct) when the actuator is engaged. The contacts located between terminals 23–24 are considered monitoring contacts, which should not be used for safety switching.
Two functions of the safety module or safety interface are:

1. To provide a means of monitoring the contacts of both safety switches for contact failure, and to prevent the machine from restarting if either switch fails; and
2. To provide a reset routine after closing the guard and returning the safety switch contacts to their closed position. This prevents the controlled machinery from restarting by simply reinserting the safety switch actuators. This necessary reset function is required by ANSI B11 and NFPA 79 machine safety standards.

Use only a positively driven, normally closed safety contact from each switch for connection to the safety module. The normally open contact may be used for control functions that are not safety-related. A typical use is to communicate with a process controller. Refer to the installation instructions provided with the safety modules for more information regarding the interface of the safety module to the machine stop control elements.

### Maintenance

#### Periodic Checks

Safety switches should be checked at each shift change or machine setup by a designated person for:

1. Breakage of the switch body or actuator,
2. Good alignment and full engagement of the actuator with the receptor,
3. Confirmation that the safety switch is not being used as an end stop,
4. Loosening of the switch or actuator mounting hardware, and
5. Verification that it is not possible to reach any hazard point through an opened guard (or any opening) before hazardous machine motion has completely stopped.

In addition, a qualified person should check for the following on a periodic schedule determined by the user based upon the severity of the operating environment and the frequency of switch actuations:

1. Check the wiring chamber for signs of contamination.
2. Check the contacts for signs of deterioration or damage.
3. Inspect the electrical wiring for continuity and damage.
4. Verify the wiring conforms to the instructions given in this datasheet.

A designated person is identified in writing by the employer as being appropriately trained to perform a specified checkout procedure. A qualified person possesses a recognized degree or certificate or has extensive knowledge, training, and experience to be able to solve problems relating to the safety switch installation (ANSI B30.2).

#### Repairs

Do not attempt any repairs to the safety interlocking switch. It contains no field-replaceable components. Return it to Banner Engineering for warranty repair or replacement.

Contact Banner Factory Application Engineering. They will attempt to troubleshoot the system from your description of the problem. If they conclude that a component is defective, they will issue a return merchandise authorization (RMA) number for your paperwork, and give you the proper shipping address.

Important: Pack the safety switches carefully. Damage that occurs in return shipping is not covered by warranty.
Specifications

Contact Rating
- 10 A at 24 V ac, 10 A at 110 V ac, 6 A at 230 V ac
- 6 A at 24 V dc
- 2.5 kV maximum transient tolerance
- NEMA A300 P300

Contact Material
- Silver-nickel alloy

Maximum Switching Speed
50 operations per minute

Short Circuit Protection
- 6 amp Slow Blow, 10 amp Fast Blow
- Recommended external fusing or overload protection

Mechanical Life
1 million operations

Weight
- 0.09 Kg (0.20 lbs.)

Connections
Screw terminals with pressure plates accept the following wire sizes:
- Stranded and solid: 20 AWG (0.5 mm²) to 16 AWG (1.5 mm²) for one wire
- Stranded: 20 AWG (0.5 mm²) to 18 AWG (1.0 mm²) for two wires

Cable Entry
- M20 x 1.5 threaded entrance
- Adapter supplied to convert M20 x 1.5 to ½"-14 NPT threaded entrance

Construction
- Glass fiber-reinforced thermoplastic UL94-VO rating; plated steel actuator

Environmental Rating
- IEC IP65

Operating Conditions
- –30 °C to +80 °C (–22 °F to +176 °F)

Certifications
- CE
- UL
- CSA

European Rating
Utilization categories: AC15 and DC13
- Switches with 1 and 2 contact pairs:
  - $U_i = 500$ V ac
  - $I_{th} = 10$ A

Banner Engineering Corp. Limited Warranty

Banner Engineering Corp. warrants its products to be free from defects in material and workmanship for one year following the date of shipment. Banner Engineering Corp. will repair or replace, free of charge, any product of its manufacture which, at the time it is returned to the factory, is found to have been defective during the warranty period. This warranty does not cover damage or liability for misuse, abuse, or the improper application or installation of the Banner product.

This Limited Warranty is exclusive and in lieu of all other warranties whether express or implied (including, without limitation, any warranty of merchantability or fitness for a particular purpose), and whether arising under course of performance, course of dealing or trade usage.

This Warranty is exclusive and limited to repair or, at the discretion of Banner Engineering Corp., replacement. In no event shall Banner Engineering Corp. be liable to buyer or any other person or entity for any extra costs, expenses, losses, loss of profits, or any incidental, consequential or special damages resulting from any product defect or from the use or inability to use the product, whether arising in contract or warranty, statute, tort, strict liability, negligence, or otherwise.

Banner Engineering Corp. reserves the right to change, modify or improve the design of the product without assuming any obligations or liabilities relating to any product previously manufactured by Banner Engineering Corp. Any misuse, abuse, or improper application or installation of this product or use of the product for personal protection applications when the product is identified as not intended for such purposes will void the product warranty. Any modifications to this product without prior express approval by Banner Engineering Corp will void the product warranties. All specifications published in this document are subject to change; Banner reserves the right to modify product specifications or update documentation at any time. Specifications and product information in English supersede that which is provided in any other language. For the most recent version of any documentation, refer to: www.bannerengineering.com.
