Overview

Banner SSM Series corner mirrors are designed for use with Banner Safety Light Screen systems and other optical safety systems, including the SGS Safety Grid System. They enable guarding along more than one side of an area using only one emitter/receiver pair.

SSM Series mirrors are compact and extremely robust to withstand industrial environments. Brackets are included for quick and easy mounting. Once mounted, a unique mirror end cap design allows rotation of the mirror to any angle. Each mirror is supplied with two mounting brackets and associated hardware.

The rear-surface glass mirrors are rated at 85 percent efficiency.

SSM Series mirrors are available in 18 lengths. SSM Series mirrors may be used with light screen sensors up to 1900 mm long. The mirror height (Y) should be a minimum of 50 mm longer than the distance between the top and bottom beams.

Mirrors should be securely mounted to a solid surface that is free from vibration. Mirrors must be mounted parallel to their sensors, with the midpoint of the mirror(s) directly in line with the midpoint of the sensor's defined area.

MSA Series stands may be used to mount SSM Series mirrors (requires adapter kit EZA-MBK-2, p/n 38722, sold separately). These stands offer an extruded channel design for convenient mirror (or sensor) height adjustment. See datasheet p/n 43687 for complete information. Several stand heights are available.

Aligning Sensors and Corner Mirrors

Mount the mirror(s) and the sensors so that they are all parallel. Use a level, if possible. Adjust the position of the sensors and the mirror(s) so that the midpoints of the mirror(s) and the sensors' defined areas are even. (A line connecting the midpoint of all components is illustrated by the dashed line in the drawing.) The midpoint of the defined area of a light curtain system can be determined by referring to the dimensions of the light curtain in its instruction manual.

Adjust the corner mirror(s) so that the angle of incidence to the mirrors equals the angle of reflection from the mirror. Sight from behind one of the sensors directly towards the mirror (or the first mirror in line). When alignment is correct, you will see the straight and centered reflection of the lens of the other sensor in the mirror.

Use the alignment indicator(s) of the safety light screen system (and the appropriate instruction manual) for final alignment.

Range Reduction Using Corner Mirrors

Use of corner mirrors reduces light curtain range (the maximum separation between the emitter and receiver). The following table lists the resultant range when using from one to four corner mirrors in the sensing path.

Light Curtain Maximum Range

Maximized excess gain is always important when installing a safety light curtain. Use hard guarding whenever possible to reduce the overall sensing range and the number of mirrors required. Also, keep sensor lenses and mirrors clean and properly aligned.

Excess Gain

$$\text{Excess Gain} = \text{Maximum Range}^2 \div \text{Separation Distance}^2$$

Given the range, excess gain can be calculated for any distance by using the inverse square law. For example, the excess gain for a 12 m range EZ-SCREEN LS system at 3 m separation, using two corner mirrors, is calculated as follows:

E.G. $\sqrt{10.1^2 + 3^2} = 11.3$

E.G. $(1x)(11.3) = 11.3x$

Excess Gain Value Guidelines	
Maximum Excess Gain Required	Operation Environment
1.5x	Clean air: no dirt buildup on lenses or mirrors
5x	Slightly dirty: slight buildup of dust, dirt, oil, moisture, etc. on lenses or mirrors. Lenses and mirrors cleaned on a regular schedule.
10x	Moderately dirty: obvious contamination on lenses or mirrors (but not obscured). Lenses and mirrors cleaned occasionally or when necessary.
50x	Very dirty: heavy contamination on lenses and mirrors. Heavy fog, mist, dust, smoke, or oil film. Minimal cleaning of lenses and mirrors.
