A 0 to 15 PSIG submersible pressure sensor (liquid level)

Submersible pressure transducers are commonly used to measure the level of liquid in large tanks using hydrostatic pressure. The height of the liquid above the position in the tank is referenced to atmospheric pressure through a vented cable. The sensing element is protected from damage and clogging by a stainless steel housing with a diaphragm protector. This device is powered by 10 V DC to 33 V DC and is well-suited for wastewater, slurry, sump, reservoirs, and most storage tank applications.
