

## Features

- Outstanding color contrast sensitivity; detects 16 levels of gray scale.
- Reliable detection of the toughest color mark contrasts, including 20% yellow against white
- Three sensing beam colors: blue, green and white, depending on model
- Fast, 50-microsecond response
- Easy-to-set automatic *Expert*-style configuration options: Static and Dynamic TEACH and Window SET, plus Manual Adjust for fine tuning via push button or remote input
- Non-volatile memory
- Ten-element light bar for clear display of received signal strength
- Fixed-convergent sensing at 10 ±3 mm (0.39" ±0.12")
- Rectangular 1.2 mm x 3.8 mm (0.05" x 0.15") sensing image at 10 mm from the lens
- Horizontal or vertical sensing image, depending on model (see table below)
- Rugged zinc alloy die-cast housing with high-quality acrylic lens suitable for food processing applications; rated IP67, NEMA 6
- Bipolar (NPN/PNP) discrete outputs with three delay settings (0, 20 or 40 ms)
- 0 to 10 mA analog output; value provides an indication of signal strength.
- Integral cable or QD connector, depending on model

## Models

Models	Beam Color	Cable*	Focus	Supply Voltage	Output Type	Sensing Image Orientation
R55ECG1	Green 525 nm	6-wire 2 m (6.5')	10 mm (0.39")	10-30V dc	Bipolar NPN/PNP and Analog 0-10 mA	<b>Parallel to sensor length</b> 
R55ECG1Q		6-pin Euro-Style QD				
R55ECB1	Blue 475 nm	6-wire 2 m (6.5')				
R55ECB1Q		6-pin Euro-Style QD				
R55ECW1	White 450-650 nm	6-wire 2 m (6.5')				
R55ECW1Q		6-pin Euro-Style QD				
R55ECG2	Green 525 nm	6-wire 2 m (6.5')				<b>Perpendicular to sensor length</b> 
R55ECG2Q		6-pin Euro-Style QD				
R55ECB2	Blue 475 nm	6-wire 2 m (6.5')				
R55ECB2Q		6-pin Euro-Style QD				
R55ECW2	White 450-650 nm	6-wire 2 m (6.5')				
R55ECW2Q		6-pin Euro-Style QD				

\* 9 m (30') cables are available by adding suffix "W/30" to the model number of the cabled version (e.g., R55ECG1 W/30). A model with a QD connector requires an accessory mating cable. See page 12.

# R55 Expert™ Color Mark Sensors

## Overview

R55 Expert (R55E) offers maintenance-free, solid-state reliability for all color contrasts found in common product and material registration applications. Fast 50-microsecond sensing response produces excellent registration repeatability, even in ultra-high-speed applications. This fast response, coupled with the small 1.2 x 3.8 mm (0.05" x 0.15") sensing image, allows color marks to be made small and inconspicuous, while being reliably sensed.

The construction of the R55E is extremely robust, with a die-cast metal housing, plastic optics, and IP67 and NEMA 6 leakproof design for harsh sensing environments. The sensor's 10-segment bargraph display and the individual indicator LEDs provide easy configuration and status monitoring.

### Indicators

The LED indicators (see Figure 1) operate as follows in RUN mode (normal operation):

**Output Conducting LED:** ON when outputs are active

**Delay Configuration Indicator LED:** OFF No OFF-delay is programmed  
ON 20- or 40-ms OFF-delay is programmed

**Light Operate LED:** ON to indicate Light Operate configuration

**Dark Operate LED:** ON to indicate Dark Operate configuration

(NOTE: Since either one of these is always ON when the sensor is operating, the combined Light/Dark Operate LEDs also provide a functional Power-ON indication.)

**10-Segment Bargraph Display:** indicates signal strength, with respect to the sensing threshold ("switchpoint").

Figure 1. R55E Series sensor features

## Sensor Configuration

Sensor configuration is accomplished via TEACH, SET and SETUP modes. After the sensing parameters are defined (using either TEACH or SET mode), SETUP mode may be used to enable the delay or to change the light/dark operate status. Manual Adjust may be used to fine-tune the thresholds (see page 7). Two push buttons, Dynamic (+) and Static (-), or the remote wire, may be used to access and set the sensing parameters. The ten-element signal strength bargraph display clearly displays the relative received signal strength.

Sensor sensitivity may be configured using any of three methods. A single switching threshold may be achieved using either Dynamic (on-the-fly) or Static TEACH, or Window SET may be used to define a sensing window, centered on a single sensing condition.

The discrete bipolar (one NPN and one PNP) outputs may be programmed in SETUP mode to include a 20- or 40-millisecond pulse stretcher (OFF-delay), if required. A third, dedicated, 0 to 10 milliamp analog output may be used for applications such as measuring or monitoring of surface brightness or texture.

Both sensing sensitivity and output setup are accomplished either by using the sensor push buttons, or by supplying input pulses via the remote input.

### Remote Configuration

The remote configuration function may be used to configure the sensor remotely or to disable the push buttons for security. Connect the gray wire of the sensor to ground (0V dc), with a remote programming switch connected between them. Pulse the remote line according to the diagrams in the configuration procedures. The duration of the individual pulses is equal to the value T:

$$0.04 \text{ seconds} \leq T \leq 0.8 \text{ seconds}$$

### Returning to RUN Mode

Some TEACH and SET modes may be exited after the 90-second time-out or by exiting the process:

- In Static TEACH or Window SET mode, press and hold the Static (-) button (or hold the remote line) for 2 seconds. The sensor returns to RUN mode without saving any new settings.

SETUP mode may be exited after the 30-second time-out or by exiting the process:

- In SETUP mode, press and hold both the Static (-) and Dynamic (+) buttons (or hold the remote line) for 2 seconds. The sensor returns to RUN mode and saves the current setting.

# R55 Expert™ Color Mark Sensors

## Static TEACH

- Establishes a single switching threshold
- Threshold position is adjustable using “+” and “-” buttons (Manual Adjust)

Static TEACH is the traditional setup method, used when two conditions can be presented by the user. The sensor locates a single sensing threshold (the switchpoint) midway between the two taught conditions, with the Output ON condition on one side, and the Output OFF condition on the other (see Figure 2).

The first condition taught is the ON condition. The Output ON and OFF conditions can be reversed by changing Light/Dark Operate status in SETUP mode (see page 7).

### Static TEACH and Manual Adjust

Using Manual Adjust with Static TEACH moves the switching threshold. Sensitivity may be adjusted at any time when the sensor is in RUN mode by clicking the “+” and “-” buttons. Each click translates to 1/2 segment on the signal strength light bar. For best sensing reliability, the light and dark conditions should register equally distant from the switchpoint on the bargraph display.

Figure 2. Static TEACH (Light Operate shown)

	Push Button 0.04 seconds ≤ “Click” ≤ 0.8 seconds	Remote Line 0.04 seconds ≤ T ≤ 0.8 seconds	Result
Access TEACH Mode	<ul style="list-style-type: none"> <li>• Press and hold Static button ≥ 2 seconds until LO and DO indicators alternately flash, then release button.</li> </ul>	<ul style="list-style-type: none"> <li>• No action required; sensor is ready for 1st TEACH condition.</li> </ul>	<p><b>Push Button TEACH only:</b></p> <p><b>LO and DO:</b> Alternately flash green</p> <p>□ : ON yellow (ready to teach output ON condition)</p> <p><b>Light Bar:</b> Goes OFF</p>
TEACH Output ON Condition	<ul style="list-style-type: none"> <li>• Present the output ON sensing condition.</li> <li>• Single-click Static button.</li> </ul>	<ul style="list-style-type: none"> <li>• Present output ON sensing condition.</li> <li>• Single-pulse the remote line.</li> </ul>	<p><b>LO and DO:</b> Alternately flash green</p> <p>□ : OFF (ready to teach output OFF condition)</p> <p><b>Light Bar:</b> Remains OFF</p>
TEACH Output OFF Condition	<ul style="list-style-type: none"> <li>• Present the output OFF sensing condition.</li> <li>• Single-click Static button.</li> </ul>	<ul style="list-style-type: none"> <li>• Wait 0.8 seconds.</li> <li>• Present the output OFF sensing condition.</li> <li>• Single-pulse the remote line.</li> </ul>	<p><b>Contrast accepted:</b> One light bar segment flashes for three seconds to indicate relative contrast, and then sensor enters RUN mode.</p> <p><b>Contrast too low:</b> Every other segment flashes for three seconds to indicate low contrast, and the sensor returns to TEACH Output ON Condition.</p>

### NOTES:

1. The sensor will return to RUN mode if either TEACH condition is not registered within 90 seconds. Also, TEACH mode may be cancelled by pressing and holding the push button for ≥ 2 seconds. In either case, the sensor will revert to the previous conditions taught (i.e., exit without save).
2. If the sensing conditions are accepted at the end of TEACH Output OFF Condition, the signal strength light bar flashes one of its ten segments for three seconds to indicate relative sensing contrast. The higher the flashing segment, the higher the measured sensing contrast. High contrast relates directly to sensing reliability. High-contrast sensing applications are most tolerant of sensing variables, such as web flutter or variations in color mark color or print density.

Figure 3. Dynamic TEACH (Light Operate shown)

## Dynamic TEACH

- Teach on-the-fly
- Establishes a single switching threshold
- Threshold position is adjustable using “+” and “-” buttons (Manual Adjust)

Dynamic TEACH is used to configure the switching threshold during actual sensing conditions. During Dynamic TEACH, the R55E takes multiple samples of the color mark against its background material and automatically sets the threshold at the optimum level. Dynamic TEACH activates the sensor’s adaptive threshold system, which continuously tracks minimum and maximum signal levels, and automatically maintains centering of the switchpoint between the light and dark conditions. The adaptive threshold system remains in effect during RUN mode to automatically adjust for changes in the light or the dark conditions. The adaptive routine saves to non-volatile memory at least once per hour.

When Dynamic TEACH mode is used to configure sensitivity, the output ON state (light or dark operate) will remain as it was last programmed. To change to either the light or the dark condition, use SETUP mode (see page 7).

### Dynamic TEACH and Manual Adjust

Sensitivity may be adjusted at any time when the sensor is in RUN mode by clicking the “+” and “-” buttons. However, when a manual adjustment is made, the adaptive threshold system is disabled (cancelled).

	Push Button	Remote Line	Result
Access TEACH Mode	<ul style="list-style-type: none"> <li>• Press and hold Dynamic button <math>\geq 2</math> seconds until LO and DO indicators alternately flash.</li> </ul> 	<ul style="list-style-type: none"> <li>• Hold remote line low (to ground) <math>&gt; 2</math> seconds.</li> </ul> 	<p><b>LO and DO:</b> Alternately flash green</p> <p> : OFF</p> <p><b>Light Bar:</b> Remains OFF</p>
TEACH Output ON and OFF Condition	<ul style="list-style-type: none"> <li>• Continue depressing the Dynamic button while sampling light and dark sensing conditions.</li> </ul> 	<ul style="list-style-type: none"> <li>• Present Output ON and OFF sensing conditions.</li> <li>• Continue to hold remote line low.</li> </ul> 	<p><b>LO and DO:</b> Alternately flash green</p> <p> : OFF</p> <p><b>Light Bar:</b> Remains OFF</p>
Return to Run Mode	<ul style="list-style-type: none"> <li>• Release the Dynamic button when finished sampling light and dark sensing conditions.</li> </ul> 	<ul style="list-style-type: none"> <li>• Release remote line switch.</li> </ul> 	<p><b>Contrast accepted:</b> One light bar segment flashes for three seconds to indicate relative contrast, and then sensor enters RUN mode.</p> <p><b>Contrast too low:</b> Every other segment flashes for three seconds to indicate low contrast, and the sensor reverts to the previously taught conditions.</p>

NOTE: If the sensing conditions are accepted at the end of Dynamic TEACH, the signal strength light bar flashes one of its ten segments for three seconds to indicate relative sensing contrast. The higher the flashing segment, the higher the measured sensing contrast. High contrast relates directly to sensing reliability. High contrast sensing applications are most tolerant of sensing variables, such as web flutter or variations in color mark color or print density.

# R55 Expert™ Color Mark Sensors

## Window SET

- Establishes a single ON condition
- All other conditions (lighter or darker) result in OFF output
- Sensing window size (sensitivity) is adjustable using “+” and “-” buttons (Manual Adjust)

The R55 Expert sensor also may be configured for a single specific target. Window SET is most useful when a product may not always appear in the same place, or when other signals may appear. Window SET designates a sensing window, with the Output ON condition inside the window, and the Output OFF conditions outside the window (see Figure 4). The sensor accepts a single sensing condition and adds switching thresholds above and below that condition to create a sensing window. Output ON and OFF conditions can be reversed by changing Light/Dark Operate status in SETUP mode.

### Window SET and Manual Adjust

Using Manual Adjust with Window SET expands or contracts the size of the window. The lighted LEDs on the light bar separate to a greater or lesser extent to exhibit the relative sensing window size.

Manually adjust the sensitivity by clicking either the “+” or “-” button; the bar graph will flash two segments centered about the sensing point. If the sensitivity is increased (-), the two lighted segments will become closer together, and farther apart if the sensitivity decreased (+). If segments do not flash while the sensitivity is being adjusted, the setting has reached its maximum and cannot be adjusted further.

Figure 4. Window SET (Light Operate shown)

	Push Button 0.04 seconds ≤ “Click” ≤ 0.8 seconds	Remote Line 0.04 seconds ≤ T ≤ 0.8 seconds	Result
Access SET Mode	<ul style="list-style-type: none"> <li>• Press and hold Static button ≥ 2 seconds until LO and DO indicators alternately flash.</li> <li>• Release button.</li> </ul> 	<ul style="list-style-type: none"> <li>• No action required; sensor is ready for sensing condition to be presented.</li> </ul>	<p><b>LO and DO:</b> Alternately flash green</p> <p>□ : ON yellow (indicating ready to teach Output ON condition)</p> <p><b>Light Bar:</b> Goes OFF</p>
Learn Switchpoint (Output ON Condition)	<ul style="list-style-type: none"> <li>• Present the Output ON sensing condition.</li> <li>• Double-click Static button.</li> </ul> 	<ul style="list-style-type: none"> <li>• Present the target (output ON) condition.</li> <li>• Single-pulse the remote wire.</li> <li>• Wait ≥ 0.8 second, then double-pulse the remote wire.</li> </ul> 	<p><b>LO and DO:</b> ON depending on condition taught</p> <p>□ : OFF</p> <p><b>Light Bar:</b> Two center segments are lit if TEACH was successful.</p>

Figure 5. SETUP Mode

## SETUP Mode

SETUP mode is used to configure discrete sensor output response for:

- Light or Dark operate
- 20- or 40-millisecond pulse stretcher (OFF-delay), if required.

It will be necessary to access SETUP mode only if the settings that result from TEACH mode are not the settings required for the application. The status LEDs indicate the output response configuration when the sensor is in RUN mode (see table below).

To change the output response settings;

1. Press and hold both push buttons for at least two seconds (or double-pulse the remote line), until the signal strength light bar turns OFF.
2. Click either push button (or pulse the remote line) to toggle through the six possible settings, indicated as follows:

Output Configuration	Delay Indicator	LO Indicator	DO Indicator
Light operate with no delay	OFF	ON	OFF
Light operate with 20 ms delay	Flashing	ON	OFF
Light operate with 40 ms delay	ON	ON	OFF
Dark operate with no delay	OFF	OFF	ON
Dark operate with 20 ms delay	Flashing	OFF	ON
Dark operate with 40 ms delay	ON	OFF	ON

3. Press and hold both push buttons (or hold the remote line) until the signal strength light bar turns ON, indicating return to RUN mode.

NOTE: If SETUP mode configuration is interrupted and remains inactive for 30 seconds, the sensor returns to RUN mode with the most recent settings (i.e., exits and saves current selection).

## Locking Out (Disabling) the Push Buttons

In addition to its configuration function, the remote input may be used to disable the push buttons for security. Disabling the push buttons prevents undesired tampering with the configuration settings. Connect the gray wire of the sensor as described on page 3, and four-pulse to either enable or disable the push buttons:

NOTE: Push buttons can be disabled/enabled from the remote line only.

# R55 Expert™ Color Mark Sensors

## Installation Notes

### Lens Location

The lens of the R55E may be installed at either of two lens ports (see Figure 6). The lens and the lens port cap are both threaded and may be exchanged by hand; no tools are required. The lens and cap both include an o-ring seal.

NOTE: Lens port cap must be installed for reliable operation.

### Mounting the Sensor

The R55E includes a total of eight M5 threaded holes used for mounting (see dimension drawing on page 10). These threaded holes are positioned to match the mounting hole patterns common to other color mark sensors. The R55E includes four M5 x 0.8 x 6 mm stainless steel cap screws and a hex key wrench.

The R55E focus is located at 10 mm (0.39") ahead of the lens surface. The R55E must be mounted within 3 mm (0.12") of this distance from the surface of the material for reliable sensing (Figure 7).

### Mounting Considerations

1. Whenever possible, it is a good idea to sense a web material at a location where it passes over a tension bar or roller, to minimize the adverse effects of web "flutter" or sag (Figure 7).
2. When sensing a color mark on a reflective (shiny) material, mount the R55E at an angle that places the lens centerline at approximately 15° off perpendicular to the material's surface (see Figure 8). This "skew angle" will minimize strong direct reflections (which tend to overwhelm the sensor), and allow the sensor to discern the relatively small optical contrast offered by difference in colors.
3. Clear materials are poor reflectors of light. When sensing a mark printed on a clear material (e.g., a clear poly web), position a reflective surface directly behind the clear material that will return light to the R55E. The printed mark, regardless of its color, then becomes the dark condition, as it blocks the light from reaching the reflective surface. Most clear materials are also shiny; it is important also to include a 15° skew angle when sensing clear materials (Figure 8).
