GENERAL QUESTIONS ABOUT WIRELESS TECHNOLOGY

WHAT FREQUENCIES ARE USED AND DO I NEED A LICENSE?

Banner's SureCross radios use the Industrial, Scientific, and Medical (ISM) bands, which do not require a license. The SureCross product line includes both 900 MHz (North America) and the 2.4 GHz (Global) models.

How do I know my data is secure and will this interfere with any of our existing wireless networks?

Banner's SureCross system does not pose a security threat to any existing networks because the SureCross system cannot physically route malicious TCP/IP packets. The SureCross protocol only carries sensor data values. It is not possible to gain access to the organization's main network through the SureCross wireless system and it is not possible for the SureCross wireless system to receive a web page or executable file over the wireless communication layer.

The SureCross protocol only carries I/O data, making it impossible for a malicious executable file to be transmitted. This protocol does not operate like an open protocol such as Wi-Fi and is not subject to the risks of an open protocol.

For more information on the security of Banner's wireless technology, refer to the <u>Wireless Security</u> technical note. Read these technical notes on <u>TDMA</u> and <u>FHSS</u> for more detailed information about how the SureCross wireless I/O products work.

HOW FAR CAN THE SIGNAL TRAVEL?

When using the standard 150 mW radios and the 2 dB antenna that ships with the radio, the signal will travel up to three miles with a clean line of sight. Higher gain antennas or the higher watt radios can send a signal between five and ten miles with line of sight. The 900 MHz FHSS technology signal can penetrate floors, walls, and other indoor obstructions and the integrated site survey capability evaluates RF signal strength to ensure your network works before it is installed. No software required.

CAN I INSTALL MULTIPLE NETWORKS IN MY FACILITY?

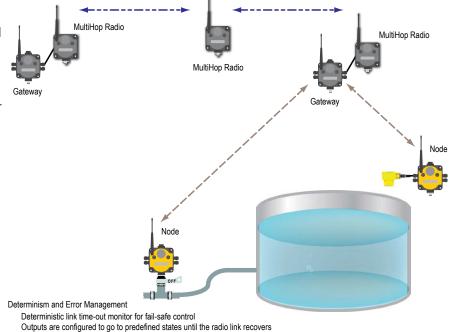

Yes. To prevent networks from interfering with each other, the Gateway and all its Nodes exchange a binding code that prevents radios outside the network from communicating with the Gateway. This is similar to "pairing" your wireless headset to your phone, but is more secure.

What are the advantages of a deterministic system?

Our deterministic system defines how network endpoints behave during the loss of communications. The network identifies when the communications link is lost and sets relevant outputs to user-defined conditions. Once the radio signal is re-established, the network returns to normal operation.

How long will the battery power last in a FlexPower application?

Banner's efficient power management technology enables a single battery power supply to provide continuous power to the radio but intermittent power to a sensor and offers a multi-year battery life. Our FlexPower technology also enables a Node to be powered by solar or 10–30V dc. Different sensors can be evaluated for battery life.

nage 2

PRODUCT OVERVIEW: DX70 POINT-TO-POINT NETWORKS

- · Only one Gateway and one Node per network
- · Binding done with the two rotary switches
- I/O is pre-mapped: input 1 on Gateway mapped to output 1 on Node
- Requires 10-30V dc power, no FlexPower Nodes
- · No LCD or push-buttons
- · Blinking LEDs indicate radio signal strength
- · Analog inputs are 0 to 20 mA only

Analog IN 2

• No Modbus or Ethernet communications options

Terminal Label DX70 Gateway			DX70 Node	Terminal Label
DI1	Discrete IN 1*	 ▶	Discrete OUT 1 or Lost Link*	D01
DI2	Discrete IN 2	\rightarrow	Discrete OUT 2	D02
DI3	Discrete IN 3		Discrete OUT 3	D03
DI4	Discrete IN 4		Discrete OUT 4	D04
Al1	Analog IN 1		Analog OUT 1	A01
AI2	Analog IN 2		Analog OUT 2	A02
D01	Discrete OUT 1 or Lost Link*		Discrete IN 1*	DI1
D02	Discrete OUT 2		Discrete IN 2	DI2
D03	Discrete OUT 3		Discrete IN 3	DI3
D04	Discrete OUT 4		Discrete IN 4	DI4
A01	Analog OUT 1		Analog IN 1	Al1

^{*} If digital output 1 is used as a lost link output (default) then digital input 1 is non-functional. Please refer to the *Configuration* section to change this setting. Input 1 is not available when the lost link output is selected.

COMMUNICATION SIGNAL STRENGTH

The rate at which the Signal LED blinks yellow indicates the signal strength between the Gateway and Node.

Analog OUT 2

Blink Rate	Definition
Every 1/8 second	Fewer than 3% missed packets
Every 1/4 second	Between 3% and 25% missed packets
Every 1/2 second	Between 26% and 50% missed packets
Every 1 second	More than 50% missed packets

DX70 Datasheet/Manual

BINDING DX70s

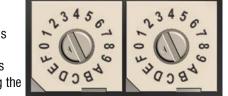

BINDING THE DX70 GATEWAY AND NODE

Binding Nodes to their Gateway ensures the Nodes only exchange data with the Gateway they are bound to. The Gateway automatically generates a unique extended addressing code when the Gateway enters binding mode. This code is then transmitted to all radios within range that are also in binding mode. After a Node is bound, the Node accepts data only from the Gateway to which it is bound. The extended addressing code defines the network, and all radios within a single network must use the same code.

If the power is applied and the Power LED is solid green and the Signal LED is solid red for more than thirty seconds (indicating an RF link error), the devices need to be bound. To bind your DX70 pair, follow these instructions.

- 1. Install the supplied antennas to both the Gateway and Node.
- 2. Apply power to both devices and position the Gateway and Node at least two meters apart. The Power LED is solid green and the Signal LED is solid red, indicating an RF link error.*
- 3. Remove the rotary dial access covers.
- 4. On the Gateway, set both the left and right rotary dials to 0, then set both the left and right rotary dials to F.
- 5. The Gateway enters binding mode. Note that both rotary dials for each device must be changed to F after applying power, not before applying power. Both the POWER and SIGNAL LEDs flash red.
- 6. On the Node, set both the left and right rotary dials to 0, then set both rotary dials to F.

 The Node enters binding mode and waits for the Gateway to respond. Both the Gateway's and Node's LEDs alternately flash red during pairing. After the devices are successfully bound, the Node's LEDs are solid red for a few seconds and the Node automatically exits binding mode. The Node Power LED is solid green and Signal LED is solid red, indicating the Node is bound. Binding should take less than twenty seconds.

- 7. Change the Gateway's rotary dials to a valid Network ID.
 - Valid Network IDs are 01 through 32, in decimal, established using both rotary dials. The left dial may be set to 0, 1, 2, or 3. The right dial may be set from 0 to 9 when the left dial is at 0, 1, or 2; or set to 0 through 2 when the left dial is at 3. (Positions A through F are invalid network ID numbers.)**
- 8. The Node automatically synchronizes to the Gateway and establishes a radio link in less than a minute.

 When a radio link is established, the Power LED is green and the Signal LED flashes yellow on both devices to indicate the signal strength.
- 9. On the Node, set both the left and right rotary dials back to 0, or any position other than F.
- 10. Replace both the rotary dial access covers.

 Regardless of the position of the Node's rotary dials, the DX70 devices within this bound pair maintain a radio link. For successful binding, the Gateway and Node should be at least two meters apart and have the antennas installed.
- * Unbound devices will have a solid green Power LED and solid red Signal LED thirty seconds after power up. Bound devices have a solid green Power LED and a flashing yellow Signal LED within thirty seconds of power up.
- ** When multiple networks operate in the same area, assign a unique Network ID (NID) to the Gateway device within each bound pair. For more information about collocated networks and Network IDs. refer to the Troubleshooting section.

BINDING DX80s

Before making any changes to the DIP switch positions, disconnect the power. For devices with batteries integrated into the housing, remove the battery for at least one minute.

DIP switch changes will not be recognized if power isn't cycled to the device.

On the Gateway

- 1. Disconnect the Gateway from its power source.
- 2. Remove the Gateway's top cover.
- 3. Move DIP switch 1 to the ON position. Extended Addressing Mode is activated using DIP switch 1. (Refer to the Device Configuration section of the device's data sheet for instructions on accessing the DIP switches.)
- 4. Apply power to the Gateway.
- 5. Triple click button 2 to enter binding mode. The red LEDs flash alternately when the Gateway is in binding mode. Any Node entering binding mode will bind to this Gateway.

ON THE NODE

- 1. Disconnect the Node from its power source. For Nodes powered by a battery integrated into the housing, remove the battery for at least one minute.
- 2. Remove the Node's top cover.
- 3. Move DIP switch 1 to the ON position.
- 4. Apply power to the Node. For Nodes powered by a battery integrated into the housing, replace the battery.
- 5. Triple click button 2 to enter binding mode. The Node enters binding mode and locates the Gateway in binding mode. The red LEDs flash alternately. After the Node is bound, the LEDs are both solid red for a few seconds. The Node cycles its power, then enters RUN mode.
- 6. Use both of the Node's rotary dials to assign a valid decimal Device Address (between 01 and 48). The left rotary dial represents the tens digit (0 through 4) and the right dial represents the ones digit (0 through 9) of the Device Address.
- 7. Repeat these steps for all Nodes that need to communicate to this Gateway.

On the Gateway

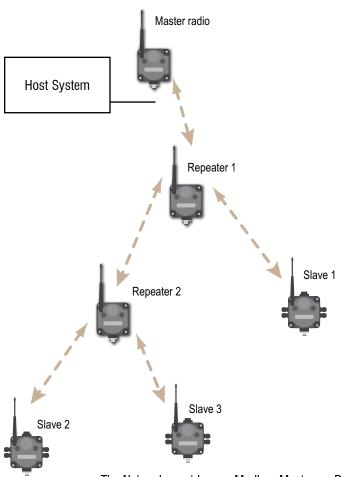

1. Single click either button 1 or button 2 on the Gateway to exit binding mode and reboot.

PRODUCT OVERVIEW: MULTIHOP (HOST CONTROLLED)

MultiHop Radio Master Mode. Within a network of MultiHop radios, there is only one master radio for the wireless network. This master radio controls the overall timing of the network and is always the parent device for the other MultiHop radios. The host system connects to this master radio. (This master radio is not a Modbus master device.)

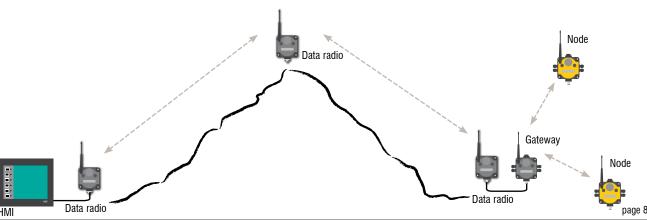

MultiHop Radio Repeater Mode. When a MultiHop radio is set to repeater mode, it acts as both a parent and a child. The repeater receives data packets from its parent, then re-transmits the data packet to the children within the repeater's network. The incoming packet of information is retransmitted on both the radio link and the local (wired) serial link.

MultiHop Radio Slave Mode. The slave radio is the end device of the MultiHop radio network. A radio in slave mode does not re-transmit the data packet on the radio link, only on the local (wired) serial bus.

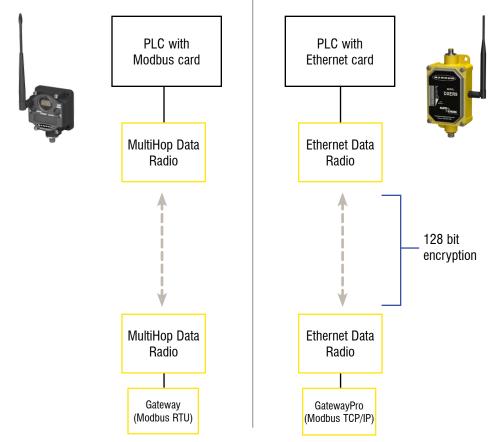

Related Links:

SureCross MultiHop Quick Start Guide

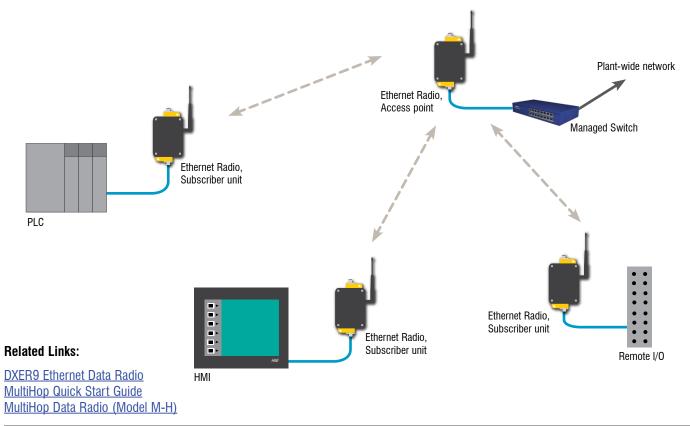

- The Network must have a Modbus Master; a DX83 or DX85 can be used as a MODBUS MASTER as well as an HMI, or PLC. (Do not confuse Modbus master with the master MultiHop radio.)
- · Networks will "self" form and "heal"
- Multiple REPEATER capability REPEATERS do require more power that SLAVES
- 50+ devices per MASTER
- 250 mW and 1 watt, DIP switch selectable power
- One radio: switch selectable MASTER, REPEATER or SLAVE radio
- 5-10 mile range with repeaters
- Various I/O configuration, analog, digital, thermocouple, thermistor, counter
- MODBUS and Transparent Mode options available by DIP switch selection on serial radios

SITE SURVEY (RADIO SIGNAL STRENGTH ANALYSIS)

Conducting a Site Survey analyzes the radio signal strength between the Gateway and any Node within the network.

Site Survey results are listed as a percentage of data packets received and indicate the signal strength of the received signal.

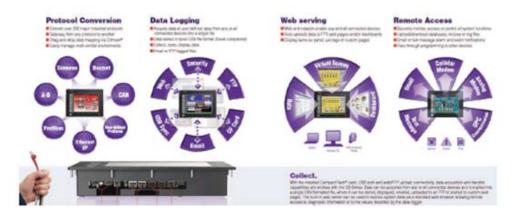

Green. Packets received at a strong signal strength. A strong signal strength is greater than -90 dBm at the receiver.

Yellow. Packets received at a good signal strength. A good signal is between -90 and -100 dBm at the receiver.

Red. Packets received at a weak signal strength. A weak signal is less than -100 dBm at the receiver.

Missed. Packets not received on the first transmission and requiring a retry.

PRODUCT OVERVIEW: USER CONFIGURATION TOOL (UCT)

The User Configuration Tool, or UCT, offers an easy way to link I/O points in your wireless network, view I/O register values graphically, and set system communication parameters when a host system is not part of the wireless network.

The UCT requires a USB to RS-485 (model number BWA-HW-006) converter cable to pass information between your computer and the Gateway.

This software is free and the latest version in both 32-bit and 64-bit versions are always available for download from the Wireless Software page on Banner Engineering's website. (The Wireless Software webpage also includes instructions about how to determine if your computer is 32-bit or 64-bit.)

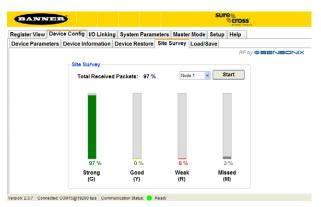

Use the Register View screen to graphically display specified Node I/O values. Up to three values can be graphically displayed as either a dial, a thermometer, or a discrete on/off status.

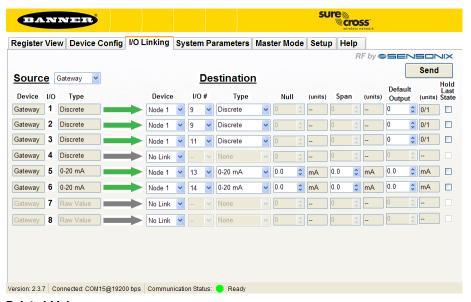

Part No: 81325 Model No: BWA-HW-006

Description: Adapter cable, USB to RS485, for use with the User Configuration Tool

software (UCT) Price Ea: \$117

Use the Site Survey screen to conduct a Site Survey between the Gateway and a selected Node.

The I/O Linking screen allows you to easily link one SureCross device's inputs to another SureCross device's outputs, as long as both devices are part of the wireless network.

PRODUCT OVERVIEW: EZ-LIGHTS

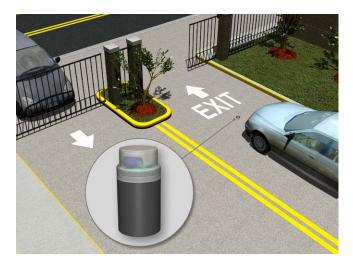

Download the <u>EZ-LIGHT product brochure</u> for more information about the variety of EZ-LIGHTs available from Banner.

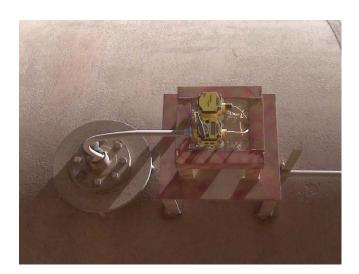

APPLICATIONS

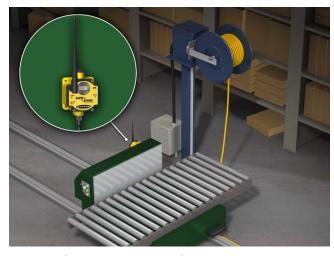

Environmental Controls

Opening Gates in a Gated Community

Monitoring Temperatures in a Rotating Kiln

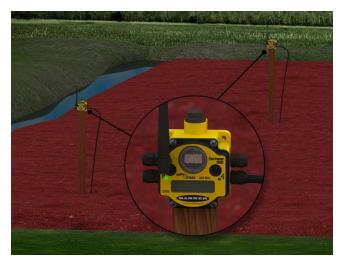

Replacing Cables on a Transport Cart

Controlling Temperature and Humidity for a Cabinet Maker

Monitoring Retention Pond Levels

Frost Protection and Soil Moisture Control in Cranberry Bogs

Monitoring Valve Temperatures in a Power Plant

Monitoring Temperature and Humidity in a Commercial Greenhouse

Monitoring Water Levels in a Neighborhood Water Tower

Landfill Methane Reclamation and Flare Stack Monitoring

Monitoring Temperatures in a Compost Pile

APPLICATION: COUNTING LEACHATE REMOVAL PUMP STROKES

Objective: Improve data collection by automating the collection of leachate removal pump counter data.

Solution: Installing a FlexPower Counter Node at the pump automates the pump stroke count.

Leachate removal from a landfill well is a primary function to guarantee consistent landfill gas production. It is typical for these pumps to be installed with a totalizing counter mounted at the top of the well head to monitor the pump cycles and to calculate the total volume of leachate removed from the well.

Benefit: Use Banner's wireless network to automatically send the counter data back to a centralized control location for logging and calculating the total volume of leachate removal.

Note: For most current installations, this counter is read manually. Automating the data collection process saves time and eliminates errors.

Water/Wastewater Application Notes

Counting Leachate Removal Pump Strokes

Leachate Level and Ground Well Monitoring

Monitoring Temperatures in Compost Windrows

Landfill Methane Reclamation and Flare Stack Monitoring

Success Story: Landfill Pump Monitoring

APPLICATION: ENVIRONMENTAL WATER RETENTION MONITORING

Objective: Monitor rain water run-off levels in ponds and/or tanks to comply with EPA and Clean Water Act Requirements.

Solution: Banner SureCross Wireless I/O

A submersible pressure transducer is placed in each pond and is connected to the battery-powered wireless Node on the bank.

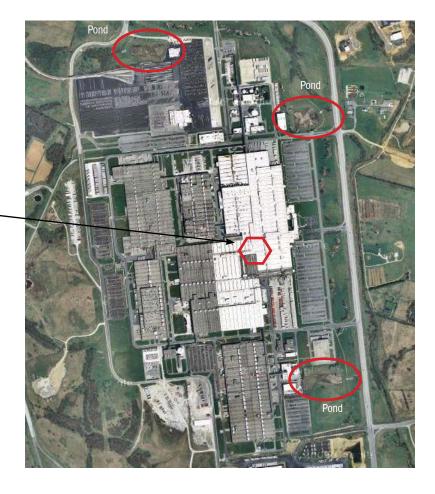

Benefit: Lower cost compliance with EPA and Clean Water Act requirements.

Note: In this example of the Toyota Georgetown, KY (TMMK) plant, the three retention ponds are separated by up to a mile and several buildings.

This level monitoring application used MultiHop data radios to transmit level information back to a central control location.

Master radio-

Application Note

Monitoring Retention Pond Levels

Application: Predictive Maintenance, Continuous Monitoring

Objective: Reduce PM maintenance on bearings and couplers; implement full time monitoring for over-temperature and/or vibration.

Solution: Banner SureCross Wireless I/O

Several configurations are possible:

- Banner Temperature Nodes will accept thermocouple inputs directly
- Banner I/O Nodes will accept T-GAGE non-contact sensor inputs for applications that cannot use a thermocouple, such as for rotating shafts or liquid temperatures measurements

T-GAGE series:

- · Non-contact temperature sensor
- · Analog or discrete

For more information, go to the <u>T-GAGE</u> section of the Banner Engineering website or download this M18T analog output <u>datasheet</u>.

Application Notes

<u>Predictive Maintenance: Motor Temperature</u> <u>Predictive Maintenance: Valve Temperatures in a Power Plant</u>

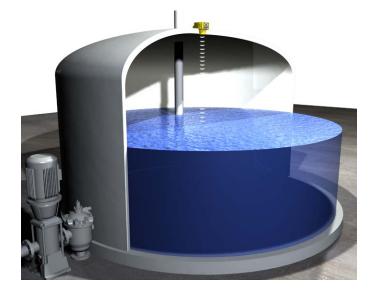

APPLICATION: TANK FARM LEVEL MONITORING

Objective: Provide continuous remote level monitoring and control of

the tanks.

Solution: Banner SureCross Wireless I/O

Benefit: Cost-effective solution.

U-GAGE Series:

- · Non-contact level sensor
- · Analog or discrete

Application Notes

Monitoring Level and Pressure in a Rotary Filler Monitoring Day Tank Levels Controlling Water Tower Pumps

APPLICATION: LOCATING AN ACTIVATED EMERGENCY SHOWER

Objective: Monitor emergency devices such as eye wash stations and defibrillator and notify plant security and the medical team if they are used.

Solution: Banner SureCross Wireless I/O

Benefit: Improve the medical response time.

Note: Banner wireless Nodes accept a wide range of input signals: presence, pressure, flow, etc.

For outside applications, the Node will accept three thermocouple inputs. This allows monitoring of heat tape to make sure the tape has not failed.

ANSI Z358.9 (2009) for Safety Showers and Eye Wash Stations requires certain compliance issues.

Application Note

Locating an Activated Emergency Shower Station

Application: Energy Conservation (Process)

Objective: Reduce expenses by controlling the process and having accurate readings from the entire system instantly. Save additional costs on the installation by using a wireless solution for all remote monitoring and control.

Input types will vary; communication is required with any device in the plant with either facilities or production.

Initial points: Steam pressure and temperature, air pressure, building differential pressure and temp, process water temperature

Solution: Banner SureCross Wireless I/O

Benefit: The new information will lead to ways of improving system efficiencies and reducing energy consumption.

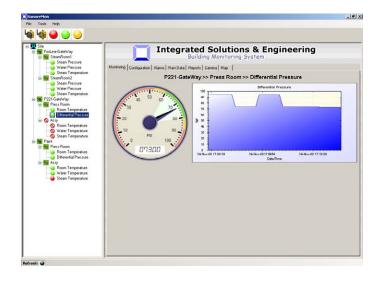

Note: The plant area is over 850,000 sq ft.

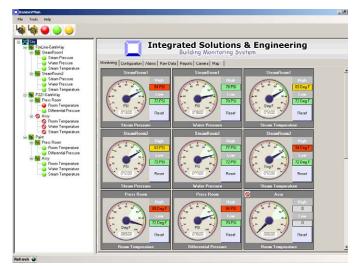

The Gateway is in the center of the plant and uses a high-gain antenna mounted above the height of the production line to reduce obstructions and ensure a robust signal with the various Nodes.

The 50 Nodes could be mounted anywhere, monitoring processes in or outside the building or providing wireless I/O directly on tools in production.

Application Note

Monitoring Power Use to Avoid Peak Use Charges Managing an HVAC System to Improve Efficiency

Application: Energy Conservation (Fans and Lighting)

Objective: Turn on and off network exhaust fans, lighting, etc. to conserve energy and lower costs with controlled shut-downs through master scheduling and remote control.

Solution: Banner SureCross Wireless I/O

Benefit: Loads that are otherwise left running during non-production periods, such as breaks, lunch, shift change, and weekends, can now be monitored and controlled, scheduled or event driven, using the host energy management system.

Note: Various 'Node enclosure kits' are assembled and pre-wired with an internal power supply and relays to replicate and monitor the existing manual start/stop NO/NC and the associated starter/contactor.

Banner Engineering Corp. warrants its products to be free from defects in material and workmanship for one year following the date of shipment. Banner Engineering Corp. will repair or replace, free of charge, any product of its manufacture which, at the time it is returned to the factory, is found to have been defective during the warranty period. This warranty does not cover damage or liability for misuse, abuse, or the improper application of the Banner product.

THIS LIMITED WARRANTY IS EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTIES WHETHER EXPRESS OR IMPLIED (INCLUDING, WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE), AND WHETHER ARISING UNDER COURSE OF PERFORMANCE, COURSE OF DEALING OR TRADE USAGE.

This Warranty is exclusive and limited to repair or, at the discretion of Banner Engineering Corp., replacement. In no event shall banner engineering corp. Be liable to buyer or any other person or entity for any extra costs, expenses, losses, loss of profits, or any incidental, consequential or special damages resulting from any product defect or from the use or inability to use the product, whether arising in contract or warranty, statute, tort. Strict liability. Negligence. Or otherwise.

Banner Engineering Corp. reserves the right to change, modify or improve the design of the product without assuming any obligations or liabilities relating to any product previously manufactured by Banner Engineering Corp.

The manufacturer does not take responsibility for the violation of any warning listed in this document.

CAUTION. Make no modifications to this product. Any modifications to this product not expressly approved by Banner Engineering could void the user's authority to operate the product. Contact the Factory for more information.

Lightning Arrestors/Surge Protection. Always use lightning arrestors/surge protection with all remote antenna systems to avoid invalidating the Banner Engineering Corp. warranty. No surge protector can absorb all lightning strikes. Do not touch the SureCross device or any equipment connected to the SureCross device during a thunderstorm.

All specifications published in this document are subject to change. Banner reserves the right to modify the specifications of products, prior to their order, without notice. Banner Engineering reserves the right to update or change documentation at any time. For the most recent version of any documentation, please refer to our website: www. bannerengineering.com. © 2009 Banner Engineering Corp. All rights reserved.
